The source card: what is behind each part

Read each row left to right. A part starts somewhere on the internet (or in the author's head), is gathered once by a tool when the page is built, is stored inside the page, and is shown by the reader's browser. Nothing in the last column reaches another website.

CARD PART	1 · WHERE IT COMES FROM *the outside source*	→ 2 · GATHERED BY *at build time, once*	→ 3 · STORED IN THE PAGE AS *static files on GitHub Pages*	→ 4 · IN THE READER'S BROWSER *at reading time*
THE SIX PARTS, IN CARD ORDER				
(1) **Number and kind**	*The author. Nothing fetched.*	**Claude** numbers the card and picks the kind label while writing the page.	`<article class="ref" id="r15">` holding `span.rnum` and `span.rkind`	**CSS** only: the disc and the small capitals. NO REQUEST
(2) **Title**	The source's own title, on the source's own page.	**Claude's web search and page-fetch tools** read the page; the title is copied exactly, never paraphrased.	`div.rtitle` (plain text)	**CSS**: bold. NO REQUEST
(3) **Provenance**	Who made it, when, its file or catalog number, its license.	**Claude** writes it from the source. The license words here also decide whether step 4b may copy a picture.	`div.rmeta` (plain text)	**CSS**: italic. NO REQUEST
(4) **Preview (words)**	What the source actually says.	**Claude** reads the source with web search and page fetch, then writes a plain summary from the source, not from the page's argument.	`div.rprev`, sometimes with a `.rfacts` line of figures	Nothing to run. NO REQUEST
(4b) **Preview (picture)**	An image, scan or PDF page at the source's address.	**bake_card_media.py** (Three Columns Tools/card-media) downloads it once with Python `urllib`, as `ThreeColumns-media/1.0`, shrinks it to about 220 px. Refuses unless the provenance line says it is free to reproduce; `--force` overrides.	A file in the site's `shots/` folder, shown by `img.rshot alt=""` inside the preview	The browser loads the copy from the page's own site, never from the source. OWN SITE ONLY
(5) **Why it is cited**	*The page's own argument. Nothing fetched.*	**Claude** states the job the source does: proves a fact, gives a date, or shows the other side.	`div.rwhy` (plain text)	Nothing to run. NO REQUEST

6 **The link, and whether it still works**	The source's web address.	**Claude** writes the link. Later, **CHECK LINKS.command** on your Mac asks every address for a reply (`HEAD`, then `GET` if refused; 25-second limit).	`a.rlink` in the page, plus the site's own `links.json` listing the dead ones	A small script reads `links.json` (uncached) and marks a dead card `.broken`. The reader leaves the page only by clicking. OWN SITE ONLY
AROUND THE CARDS				
A **Citation numeral** in columns A and C	*The author. Nothing fetched.*	**Claude** places it where the claim is made.	`<span class="fn" data-ref="r15">`	**JavaScript**: finds the card by id, opens column B on a phone, scrolls it to mid-screen, adds `.flash`. The Back arrow returns to the numeral. NO REQUEST
W **Wikipedia term** hover card	Wikipedia's summary service: `en.wikipedia.org/api/rest_v1/page/summary/`*title*	**BAKE WIKI PREVIEWS.command** runs `bake_wiki_previews.py` on your Mac, one call per term. (Run on the Mac because Wikipedia rate-limits Claude's sandbox.)	A JSON block inside the page, `<script type="application/json" id="wk-data">`, each entry dated and credited CC BY-SA	**wiki-preview.js** reads the stored text on hover or tap. A term with no entry stays plain. NO REQUEST
i **Internal card** at the top of column B	*The page's own history.*	**Claude** updates it with each change.	Ordinary HTML: who wrote the page, when it last changed, what changed	Nothing to run. NO REQUEST

The layer under every row: hosting

The finished page and its `shots/`, `links.json` and scripts are plain files in a git repository, sent to GitHub Pages by the PUBLISH command. There is no server program, database, login or form.

Why nothing is fetched live

The browser's same-origin rule (CORS) blocks a page from reading most other sites anyway. Baking at build time also means the page works offline, archives whole, sends no reader's address to anyone else, and has no live connection to hijack. The cost: every preview is a dated snapshot.

1 outside source · 2 build tool · 3 stored in page · 4 reader's browser · NO REQUEST nothing loaded · OWN SITE ONLY one file from the page's own site
